

Email Encryption on Mobile Devices

With the widespread use of smartphones and tablets in business today, email encryption solutions must provide a seamless user experience across all devices. Unfortunately, many legacy solutions and services were not designed to function well on these devices, leaving users frustrated or unable to access or manage encrypted messages and files on their smartphones and tablets.

DataMotion SecureMail is an email encryption service designed and optimized for use with mobile devices to provide the seamless user experience subscribers and recipients want and need.

Using SecureMail on your mobile device

There are two ways to send and receive encrypted email and files on mobile devices using SecureMail:

- SecureMail web portal: optimized for mobile, the web portal auto-detects the parameters of your mobile device to provide the best touch-screen interface and display. This approach works even with devices yet to be delivered to market.
- SecureMail mobile email client integration: SecureMail can be configured as a POP3 email service to function within the native email client on your iOS, Android or Windows based mobile device.

There is no need for your users to download apps and keep them up to date. This is a great benefit particularly when it comes to compliance with corporate BYOD policies.

We work how you work

SecureMail works the way you do, which means that you can send secure email whether you are in the office or on the move. SecureMail can be accessed from the web portal or fully integrated within mobile devices' existing email clients making it convenient and incredibly easy to use. The advantage to this approach is that encrypted email will be sent and received in a way already familiar to the user, so it will get used.

Features/Benefits

- No application to download, install or update
- Mobile optimized for subscribers and for 3rd party mobile recipients
- Simple interface to view, send, and forward existing messages
- Access via secure POP3 and SMTP connection, or via secure web portal
- Encrypted email will be sent and received in a way already familiar to the user
